

DYSPHAGIA: HOW IS IT ASSESSED?

Clinical examination:

Looking, feeling and listening for signs of dysphagia, sometimes using a stethoscope.

Videofluoroscopy:

An x-ray where food and drink is mixed with barium so we can see exactly what happens when a person swallows.

Fibreoptic endoscopic evaluation of swallowing (FEES):

A small endoscope is passed through the nose to visualise the larynx (voice box) and airway during the swallow.
